Dental Clinic Website

Premium responsive website starter · Setup, deployment and client handover guide

Included: polished public website, 19 treatment services, appointment request form, password-protected clinic manager, appointment status updates, photo upload/delete gallery, mobile navigation and deployment files.

Important: this is a professional starter, not a fully verified clinic listing. The provided Google Maps search link does not clearly reveal the clinic's exact name and street address in the supplied details. Confirm these with the client before publishing.

1. What to change before the client sees it

• Replace the temporary name “SmileCraft Dental Clinic” with the clinic's exact approved name.
• Confirm the full address and paste the direct Google Maps place link.
• Confirm whether Sunday/holiday hours apply; the brief only specified 10 AM–2 PM and 5 PM–10 PM.
• Replace stock images with licensed/clinic-owned images and obtain written consent for identifiable patients.
• Have the dentist/owner approve services, treatment descriptions, contact details and all claims.

2. Run on your Windows laptop

```
py -m venv .venv
.\.venv\Scripts\Activate.ps1
pip install -r requirements.txt
$env:SECRET_KEY="a-long-random-secret"
$env:ADMIN_USERNAME="clinicadmin"
$env:ADMIN_PASSWORD="a-long-unique-password"
$env:CLINIC_NAME="Actual Clinic Name"
$env:CLINIC_ADDRESS="Verified full address"
$env:CLINIC_PHONE="8483835641"
$env:CLINIC_MAPS_URL="paste-direct-place-link"
python app.py
```

Open http://127.0.0.1:5000. Clinic manager login: http://127.0.0.1:5000/admin/login. Keep the admin password private.

3. How the clinic staff use it

1) Open /admin/login and sign in.
2) Review appointment requests, call patients, and confirm the appointment directly. Form submissions are requests, not confirmed bookings.
3) Search by patient name, phone or service; filter by status.
4) Change a request to New, Confirmed, Completed or Cancelled and click Save.
5) In Website photo gallery, choose JPG/PNG/WEBP (up to 5 MB), add a caption and upload. It appears on the public homepage. Remove photos from the same dashboard.
6) Sign out after use.

4. Deployment plan for a two-day handover

Day 1: verify clinic information, replace branding/photos, run locally, test on phone and laptop, test appointment submissions and photo upload, commit to a private GitHub repository if desired.
Day 2: deploy to a persistent Python host such as PythonAnywhere, set environment variables, configure WSGI/virtual environment, enable HTTPS, test the live site, train staff and hand over credentials securely.

Deployment note: SQLite and uploaded photos need persistent storage. Avoid ephemeral hosting unless you move uploads to persistent/object storage and use a suitable production database. Check the host's current deployment documentation; dashboard steps can change.

5. Security and privacy essentials

Use a unique long secret key and strong admin password; never publish credentials in GitHub or send them in public messages. Keep the dashboard restricted to authorised staff. Set up backups for the SQLite database and uploads. Use HTTPS. Add a clinic-approved privacy notice and obtain consent before publishing patient photos. Do not collect unnecessary health information through the form. This starter is not a medical emergency service.

6. Files

app.py = Flask routes and database; templates/ = public site and manager pages; static/css/style.css = design; static/js/main.js = responsive navigation and booking helper; requirements.txt = Python packages; Procfile = host process command; README.md = setup notes. Individual source-code PDFs are provided in this folder for reference, but use the actual source files from the ZIP when running the app.
